Partiel S3
Architecture des ordinateurs

Durée : 1 h 30

Exercice 1 (9 points)

Dans cet exercice, vous devrez réaliser trois sous-programmes qui copient des octets situés à un emplacement mémoire vers un autre emplacement mémoire. Aucun registre ne devra être modifié en sortie de vos sous-programmes. Chacun de ces trois sous-programmes possède les entrées suivantes :

Entrées : **A1.L** pointe sur l'emplacement source des octets à copier.
A2.L pointe sur l'emplacement destination.
D0.L contient le nombre d'octets à copier (entier non signée).

La conception de chaque sous-programme est indépendante.

1. Réalisez le sous-programme **CopyInc** qui copie les données en commençant par le premier octet et qui incrémente les adresses (*cf.* exemple ci-dessous). On suppose que lors d'un appel à **CopyInc** :
   - le registre **D0** n'est jamais nul ;
   - les registres **A1** et **A2** ne sont jamais égaux.

2. Réalisez le sous-programme **CopyDec** qui copie les données en commençant par le dernier octet et qui décrémente les adresses (*cf.* exemple ci-dessous). On suppose que lors d'un appel à **CopyDec** :
   - le registre **D0** n'est jamais nul :
   - les registres **A1** et **A2** ne sont jamais égaux.

3. Réalisez le sous-programme **Copy** qui appelle **CopyInc** si l'adresse de l'emplacement destination est inférieure stricte à l'adresse de l'emplacement source, ou qui appelle **CopyDec** si l'adresse de l'emplacement destination est supérieure stricte à l'adresse de l'emplacement source. On suppose que lors d'un appel à **Copy** :
   - le registre **D0** peut être nul : dans ce cas, aucun octet ne doit être copié ;
   - les registres **A1** et **A2** peuvent être égaux : dans ce cas, aucun octet ne doit être copié.

Exemple pour **A1** = \$1000, **A2** = \$2000 et D0 = 3.	
CopyInc : (\$1000) → (\$2000)	**CopyDec** : (\$1002) → (\$2002)
(\$1001) → (\$2001)	(\$1001) → (\$2001)
(\$1002) → (\$2002)	(\$1000) → (\$2000)

Exercice 2 (4 points)

Remplir le tableau présent sur le document réponse. Donnez le nouveau contenu des registres (sauf le **PC**) et/ou de la mémoire modifiés par les instructions. **Vous utiliserez la représentation hexadécimale. La mémoire et les registres sont réinitialisés à chaque nouvelle instruction.**

Valeurs initiales :

```
D0 = $0004FFFF   A0 = $00005000   PC = $00006000
D1 = $0001000A   A1 = $00005008
D2 = $FFFFFFFD   A2 = $00005010

$005000  54 AF 18 B9 E7 21 48 C0
$005008  C9 10 11 C8 D4 36 1F 88
$005010  13 79 01 80 42 1A 2D 49
```

Exercice 3 (3 points)

Trouvez le nombre manquant pour chaque addition ci-dessous afin d'obtenir la bonne combinaison de *flags* (vous utiliserez la représentation hexadécimale). Si plusieurs solutions sont possibles, vous retiendrez uniquement la plus petite. Remplir le tableau présent sur le document réponse.

1. Addition sur 8 bits : `$7F + $?` avec **N** = 1, **Z** = 0, **V** = 1, **C** = 0
2. Addition sur 16 bits : `$98BD + $?` avec **N** = 0, **Z** = 1, **V** = 0, **C** = 1
3. Addition sur 32 bits : `$98BD + $?` avec **N** = 1, **Z** = 0, **V** = 0, **C** = 0

Exercice 4 (4 points)

Soit les quatre programmes ci-dessous :

```
Prog1       tst.b    d5
            beq      quit1
            moveq.l  #2,d1
quit1
```

```
Prog2       tst.w    d5
            bpl      quit2
            moveq.l  #2,d2
quit2
```

```
Prog3       move.w   #100,d7
loop3       addq.l   #1,d3
            dbra     d7,loop3     ; DBRA = DBF (DBcc avec cc = F)
```

```
Prog4       move.l   #1000,d0
loop4       addq.l   #1,d4
            addi.l   #10,d0
            cmpi.l   #2000,d0
            bne      loop4
```

- Chaque programme est indépendant.
- Les valeurs initiales des registres sont identiques pour chaque programme.
- Valeurs initiales des registres :
  D1 = `$00000001`
  D2 = `$00000001`
  D3 = `$00000000`
  D4 = `$00000000`
  D5 = `$0067A200`

Répondre sur le document réponse.

1. Quelle sera la valeur du registre **D1** après l'exécution du programme **`Prog1`** ?
2. Quelle sera la valeur du registre **D2** après l'exécution du programme **`Prog2`** ?
3. Quelle sera la valeur du registre **D3** après l'exécution du programme **`Prog3`** ?
4. Quelle sera la valeur du registre **D4** après l'exécution du programme **`Prog4`** ?

Revised by Peter Csaszar, Lawrence Tech University – 2004-2006

An	Address register (16/32-bit, n=0-7)
Dn	Data register (8/16/32-bit, n=0-7)
Rn	any data or address register
s	Source, **d** Destination
e	Either source or destination
#n	Immediate data, **i** Displacement
BCD	Binary Coded Decimal
↑	Effective address
1	Long only; all others are byte only
2	Assembler calculates offset
3	Branch sizes: .B or .S -128 to +127 bytes, .W or .L -32768 to +32767 bytes
4	Assembler automatically uses A, I, Q or M form if possible. Use #n.L to prevent Quick optimization

SSP	Supervisor Stack Pointer (32-bit)
USP	User Stack Pointer (32-bit)
SP	Active Stack Pointer (same as A7)
PC	Program Counter (24-bit)
SR	Status Register (16-bit)
CCR	Condition Code Register (lower 8-bits of SR)

N negative, **Z** zero, **V** overflow, **C** carry, **X** extend
* set according to operation's result, ≡ set directly
- not affected, **0** cleared, **1** set, **U** undefined
