

Final Exam S3

Computer Architecture

Duration: 1 hr 30 min

Write answers only on the answer sheet.

Do not use a pencil or red ink.

Exercise 1 (3 points)

Complete the table shown on the [answer sheet](#). Write down the new values of the registers (except the PC) and memory that are modified by the instructions. **Use the hexadecimal representation. Memory and registers are reset to their initial values for each instruction.**

Initial values: D0 = \$FFFF0005 A0 = \$00005000 PC = \$00006000
 D1 = \$FFFFFFE0 A1 = \$00005008
 D2 = \$AAAA0018 A2 = \$00005010

\$005000	54 AF 18 B9 E7 21 48 C0
\$005008	C9 10 11 C8 D4 36 1F 88
\$005010	13 79 01 80 42 1A 2D 49

Exercise 2 (2 points)

Complete the table shown on the [answer sheet](#). Give the result of the additions and the values of the N, Z, V and C flags.

Exercise 3 (4 points)

Let us consider the following program. Complete the table shown on the [answer sheet](#).

```

Main      move.l  #$ff,d7
next1     moveq.l #1,d1
          cmpi.w  #$fe,d7
          ble    next2
          moveq.l #2,d1
next2     moveq.l #1,d2
          cmpi.b #$fe,d7
          ble    next3
          moveq.l #2,d2
next3     clr.l   d3
          move.l  #518,d0
loop3     addq.l  #1,d3
          subq.b  #2,d0
          bne    loop3
next4     clr.l   d4
          clr.l   d0
loop4     addq.l  #1,d4
          dbra   d0,loop4      ; DBRA = DBF

```

Exercise 4 (11 points)

All the questions in this exercise are independent. **Except for the output registers, none of the data or address registers must be modified when the subroutine returns.** A string of characters always ends with a null character (the value zero). For the whole exercise, we assume that the strings of characters are never empty (they contain at least one character different from the null character).

1. Write the **GetStart** subroutine that returns the address of the first occurrence of a character in a string.

Input: **A0.L** points to a string of characters.

D0.B holds the ASCII code of a character. We call this character C and we assume that it is in the string pointed to by **A0.L**.

Output: **A0.L** points to the first occurrence of C in the string.

Be careful. The GetStart subroutine must contain 4 lines of instructions at the most.

2. Write the **GetEnd** subroutine that returns the address located right after the last character in a sequence of identical characters. We consider that a sequence of identical characters can be made up of either a single character or several identical characters.

Input: **A0.L** points to a non-null character in a string. We call this character C.

Output:

- If the character that follows C is different from C, then **A0.L** will point to the character that follows C.
- If there are several C characters in a row, then **A0.L** will point to the character that follows the last C.

For instance, let us consider the following string: “Heeeellooooo Woorld”

- If **A0.L** points to “H”, the returned address will be that of the first “e”.
- If **A0.L** points to the first “e”, the returned address will be that of the first “l”.
- If **A0.L** points to the first “l”, the returned address will be that of the first “o”.
- If **A0.L** points to the first “o”, the returned address will be that of the space character.
- If **A0.L** points to “r”, the returned address will be that of the last “l”.
- If **A0.L** points to “d”, the returned address will be that of the null character.

Be careful. The GetEnd subroutine must contain 12 lines of instructions at the most.

3. By using the **GetStart** and **GetEnd** subroutines, write the **SuccessiveCount** subroutine that counts the number of characters in a sequence of identical characters. Such a sequence is in a string. If several sequences based on the same character are in the string, only the first sequence must be taken into account.

Input: **A0.L** points to a string of characters.

D0.B holds the ASCII code of a character. We call this character C and we assume that it is in the string pointed to by **A0.L**.

Output: **D0.L** holds the number of C characters in a row from the first C.

For instance, let us consider that **A0.L** points to the following string: “Heeeellooooo Woorld”

- If **D0.B** holds “H”, the returned value will be 1.
- If **D0.B** holds “e”, the returned value will be 4.
- If **D0.B** holds “l”, the returned value will be 2.
- If **D0.B** holds “o”, the returned value will be 5.
- If **D0.B** holds “W”, the returned value will be 1.
- If **D0.B** holds “d”, the returned value will be 1.

Be careful. The SuccessiveCount subroutine must contain 12 lines of instructions at the most.

ANSWER SHEET TO BE HANDED IN

Exercise 1

Instruction	Memory	Register
Example	\$005000 54 AF 00 40 E7 21 48 C0	A0 = \$00005004 A1 = \$0000500C
Example	\$005008 C9 10 11 C8 D4 36 FF 88	No change
MOVE.L #2943,4(A0)		
MOVE.B \$5011,34(A2,D1.L)		
MOVE.W 18(A0),-24(A0,D2.W)		

Exercise 2

Operation	Size (bits)	Result (hexadecimal)	N	Z	V	C
\$5D + \$6F	8					
\$87654321 + \$ABCDEF00	32					

Exercise 3

Values of registers after the execution of the program. Use the 32-bit hexadecimal representation.	
D1 = \$	D3 = \$
D2 = \$	D4 = \$

Exercise 4

GetStart

GetEnd

SuccessiveCount
